Project Objective

To construct a continuous, arbitrage-free zero-coupon yield curve (spot curve) using a snapshot of 347 active, USD-denominated U.S. Treasury Notes and Bonds.

Background & Data

The dataset provides a cross-section of market pricing for 347 active United States Government securities. The data, captured from a Bloomberg search query on February 24, 2025, includes issue dates, maturities, bid/ask prices, and coupon rates for current and subsidiary U.S. Treasury Notes and Bonds.

Deliverable

A fully calibrated spot yield curve and its corresponding discount factor function, enabling the accurate interpolation of interest rates and the pricing of cash flows at any given maturity.
